

IUFRO Spotlight is an initiative of the International Union of Forest Research Organizations. Its aim is to introduce, in a timely fashion, significant findings in forest research from IUFRO officeholders and member organizations to a worldwide network of decision makers, policy makers and researchers.

IUFRO will encapsulate, and distribute in plain language, brief, topical and policy-relevant highlights of those findings, along with information on where/how to access the full documents. The **IUFRO Spotlight** findings will be distributed in a periodic series of emails as well as blog postings.

Urban Park Perks' Research Rounded Up & Rated

IUFRO Spotlight #13 / May 2013

Green areas and parks provide many benefits to urban spaces. That's what people have said for years – but without an awful lot of evidence to back it up.

Now there is an evidence-based report, **Benefits of Urban Parks: A systematic review**, offering some support to that assertion.

The recent study, one the authors believe is a first-of-its-kind, draws conclusions based on green space related research published in a number of top-level scientific publications.

It offers a comprehensive and critical assessment that evaluates the strength of the evidence supporting a series of park benefits.

Across the globe, the report will be a useful tool for planners, policy-makers and politicians, especially at the municipal level, giving them a better foundation on which to base decisions for building or preserving urban parks. At the same time green space managers can use the findings to argue for parks based on a particular range of benefits (while supporting research in some of the less-explored areas) and researchers can begin to address some of the identified research gaps.

Already, green space managers in cities such as Helsinki, Oslo and New York have informed the authors that they will begin using the report immediately.

The report finds a significant amount of evidence to back up claims that green spaces do benefit urban biodiversity, local cooling and increased property values, as well as some evidence – ranging from moderate to strong – that indicates direct and indirect health benefits.

For example, in terms of health benefits in the studies they analyzed, the authors found strong evidence linking urban parks and physical activity, moderate-to-strong evidence indicating a link to decreased obesity and a moderate amount of evidence supporting findings of reduced stress and improved self-reported health and mental health.

The authors also noted reduced stroke mortality, reduction of ADHD symptoms and reduced cardiovascular/respiratory morbidity were indicated in respective single high-quality studies – not enough on which to base any conclusions, but certainly pointing to a need for more studies in those areas.

For other benefits, such as tourism promotion and water regulation, the evidence is weaker. The authors note this does not necessarily mean those benefits do not exist; just that more research is also needed in those particular subject areas before any conclusions can be reached.

The International Federation of Parks and Recreation Administration (Ifpra) assigned this study. It is an international organization that, among other things, promotes the benefits of parks, recreation, cultural and leisure services, including urban parks. The organization wanted to ensure that its promotion is based on sound evidence. So a research study team of four, representing three different institutions, three different disciplines, and four nationalities was set up. They spent most of last year undertaking a systematic review of the scientific evidence for urban park benefits.

These four authors are: Dr. Cecil C. Konijnendijk van den Bosch of the University of Copenhagen and Swedish University of Agricultural Sciences; Dr. Matilda Annerstedt, of the Swedish University of Agricultural Sciences; Sreetharan Maruthaveeran, M.Sc, of the University of Copenhagen and Forest Research Institute Malaysia; and Dr. Anders B. Nielsen of the Swedish University of Agricultural Sciences. They all work at IUFRO Member Organizations and two of them - Cecil C. Konijnendijk van den Bosch and Sreetharan Maruthaveeran - are Deputy Coordinators in IUFRO's Urban Forestry Research Group 6.07.00.

The full report can be found at: <http://www.ifpra.org/images/park-benefits.pdf>

The findings reported in *IUFRO Spotlight* are submitted by IUFRO officeholders and member organizations. IUFRO is pleased to highlight and circulate these findings to a broad audience but, in doing so, acts only as a conduit. The quality and accuracy of the reports are the responsibility of the member organization and the authors.

Suggestions for reports and findings that could be promoted through *IUFRO Spotlight* are encouraged. To be considered, reports should be fresh, have policy implications and be applicable to more than one country. If you would like to have a publication highlighted by *Spotlight*, contact: **Gerda Wolfrum, IUFRO Communications Coordinator, [wolfrum\(at\)iufro.org](mailto:wolfrum(at)iufro.org)**

The International Union of Forest Research Organizations (IUFRO) is the only worldwide organization devoted to forest research and related sciences. Its members are research institutions, universities, and individual scientists as well as decision-making authorities and other stakeholders with a focus on forests and trees.
